ABSTRACT

One of the thrust areas in drug delivery research is transdermal drug delivery systems (TDDS) due to their characteristic advantages over oral and parenteral drug delivery systems. Development of functional delivery systems is a challenging task. Transdermal drug delivery involves the transport of drug across the skin. Optimal physicochemical properties are required in drug candidates for delivery via transdermal patches. Traditional transdermal patches can be divided into two categories – reservoir-based and matrix-based, according to their physical structure. Transdermal drug delivery offers advantages like patient compliance, avoidance of firstpass metabolism, and large surface area of skin over which to deliver the drug, quick termination of dosing, etc. However, only a few drug products with optimum characteristics have been successfully marketed to deliver a drug through the skin. This study concentrates on matrix-based transdermal drug delivery systems, formulated using glimepride and polymers in different ratios. The release of glimepride appears to be dependent on hydrophilicity of the matrix. Moderately hydrophilic matrices showed best release. The predominant release mechanism of drug through the fabricated matrices was believed to be by diffusion mechanism. The release of glimepride from the optimized formulation F4 follows zero order kinetics and the mechanism of drug release was concluded as diffusion controlled.

KEYWORDS: Transdermal patches, Matrix-based, Reservoir-based, Patient Compliance, Optimal physicochemical properties.

INTRODUCTION

Transdermal drug delivery systems (TDDS), also known as patches, are dosage forms designed to deliver a therapeutically effective amount of drug across a patient's skin. In order to deliver therapeutic agents through the human skin for systemic effects, the comprehensive morphological, biophysical and physicochemical properties of the skin are to be considered. Transdermal delivery provides a leading edge over injectables and oral routes by increasing patient compliance and avoiding first pass metabolism respectively¹. Transdermal delivery not only provides controlled, constant administration of the drug, but also allows continuous input of drugs with short biological half-lives and eliminates pulsed entry into systemic circulation, which often causes undesirable side effects. Thus various forms of Novel drug delivery system such as Transdermal drug delivery systems, Controlled release systems, Transmucosal delivery systems etc. emerged. Several important advantages of transdermal drug delivery are limitation of hepatic first pass metabolism, enhancement of therapeutic efficiency and maintenance

of steady plasma level of the drug. Transdermal formulation maintain drug concentration within the therapeutic window for prolonged period of time ensuring that drug levels neither fall below the minimum effective concentration nor exceed the maximum effective concentration. Glimepride is the first III generation sulfonyl urea against Diabetes mellitus-II. Though glimepride has 100% oral absorption, due to high first pass metabolism it has a low and variable bioavailability. The drug is given in 4mg twice a day and hence there is less patient compliance. The physicochemical properties of glimepride i.e., slight water solubility, low molecular weight (490.62), high first pass metabolism and its suitable elimination half-life ($t_{1/2}=5$ h), make it a suitable candidate for administration by transdermal route. As Glimepride has first pass metabolism, transdermal patches were designed with an objective to increase its bioavailability. Controlled release formulation was developed with polymers HPMC (Hydroxy propyl methyl cellulose), EC (Ethyl cellulose) in various proportions which released the drug over an extended period of 24 hours giving an

Virtual Screening of CDK9 Inhibitors as Potential Anti Cancer Drugs

ABSTRACT

Cell cycle inhibition is important hallmark of anti cancer research. CDKs are divided into two types based on their Cell cycle controlling and transcriptional control. CDK 9, a transcriptional regulator serves as potential drug target. Only few drugs are under clinical trials phase 1/2/3 of CDK 9 inhibitory potential. 3BLR (pdb id) is used as docking target. Virtual screening is carried out based on the pharmacophore information generated from literature. Docking is carried out using Molegro virtual docker with all the compounds and top ranking compounds are shortlisted. The best compound (ZINC91643349) was identified and further analyzed by In vitro assays.

Keywords

CDK9, CDK9 inhibitors, Virtual Screening, Molecular Docking

1. INTRODUCTION

Regulation of cell cycle forms the key event in cell growth and division which maintains optimal cell volume in a tissue at the physiological states. Dysregulation of genes involved in cell cycle regulation can lead to abnormal cell division which is otherwise manifested as cancer.^[1,2,3] Cyclin and cyclin-dependent kinases are family of evolutionary conserved serine/threonine kinases that are modular components of the core clock machinery of the cell cycle.^[4] In each phase of the cell cycle, CDK phosphorylates distinct proteins and regulate the cell cycle. Deregulation of cyclins, alterations or absence of CDK inhibitors can disturb the cell cycle regulation resulting in tumor formation.

In addition to its crucial role in cell cycle regulation, CDKs also participate in physiological process such as neuronal function and forms an important protein in transcription machinery. CDKs can generally be classified into two major groups.^[5-6] Type 1 include CDK1 to CDK6 that control the cell cycle progression, whereas Type 2 group includes CDK8, CDK9, CDK12 and CDK19 which are linked to gene transcription regulation by RNA polymerase II.^[7] CDK7 and

CDK20 act in both cell cycle control and transcription processes. Several CDKs (such as CDK10, CDK11A, CDK11B, CDK13) are involved in RNA processing.^[8] CDK9 is a catalytic subunit of positive transcription elongation factor activated by either cyclin T or K. CDK9/T1 complex are highly expressed in neuro ectodermal and neuroblastoma tumors.^[9]

CDKs does not operate in isolation, a synergistic association with proteins called cyclins, catalyses the kinase activity of CDKs. After the association with cyclin, CDKs result in stimulating the transcription elongation of RNA pol II enzyme. The inhibitors of CDK9 are under clinical trials and some of them have entered phase 2 or phase 3, while some of the inhibitors have been now approved by FDA, nevertheless, still raises high concerns of hypersensitivity.^[10] Hence the present study pursues to identify potential CDK9 inhibitors through high throughput virtual screening approaches.

2. METHODOLOGY

2.1 Preparation of Protein

The crystal Structure of Human CDK9/cyclinT1 in complex with Flavopiridol was retrieved with PDB ID: 3BLR.^[11,12] The X-Ray diffraction structure of CDK9 receptor had a resolution of 2.8 Å, R value of 0.176 and R free value of 0.228 unit cells.

2.2 Dataset Selection

Derivatives of 2-anilino-4-(thiazol-5-yl) pyrimidine transcriptional CDK inhibitors [Table1] are used in the current study.^[13] Derivatives of N-phenyl-imidazo[4,5-b] pyridin-2-amines, 4-indazolyl-N-phenylpyrimidin-2-amines and N-phenyl-4-pyrazolo[3,4-b] pyridin-pyrimidin-2-amines [Table-2] were used as potent anti-proliferative and CDK9 inhibitory activities in the present study.^[14] Table 3 identifies the evaluated ADME physico chemical properties of all ligands under study. The property of each ligand was calculated in order to identify any ligand violating Lipinski rule of 5.^[15] Based on these parameters the rule for searching of inhibitors from zinc databases has been designed.^[16]

EFFECT OF *SALIX TETRASPERMA* ROXBURGH ON FRUCTOSE INDUCED HYPERTENSION IN RATS

ABSTRACT

Objective: The present study was designed to evaluate the effect of the ethanolic and aqueous extract of *Salix tetrasperma* Roxburgh on blood pressure by fructose induced hypertensive rats.

Methods: The *Salix tetrasperma* Roxburgh leaves were evaluated for antihypertensive potential by using fructose-induced hypertension model in Wistar albino rats. The test animals were given high fructose (10%) diet for 21st days to induced hypertension. Subsequently, the 200 and 400 mg/kg/day (p.o.) doses of ethanolic and aqueous extracts of *Salix tetrasperma* leaves were administered to the different groups of hypertensive and normal animals. The hypertensive condition of the experimental animals was confirmed on 21st day by measuring systolic, diastolic and mean arterial pressure (SBP, DBP, MAP) using noninvasive BP (NIBP) system for rodents. The SBP, DBP, MAP were again recorded on day 0 d, 7th, 14th and 21st day of administration standard and test extracts. The normal control group of animals were given normal diet and administered normal saline throughout the experiment.

Results: The both test extracts significantly reduced SBP, DBP and MAP significantly ($P < 0.05$) lowered blood pressure effect in 0 d, 7th day at the dose of 200 and 400 mg/kg in fructose induced hypertensive rats. On 14th day the test extracts at the doses of 400 mg/kg significantly reduce only DBP and MAP. However, the treatment is continued for 21 d but no significant activity observed. The test extracts reveals that antihypertensive of *Salix tetrasperma* Roxburgh in dose dependent manner in hypertensive control rats.

Conclusion: These observations established the traditional claim and thus *Salix tetrasperma* Roxburgh could be a potent antihypertensive agent for use in future. The phyto constituents present in the test samples may be responsible for the hypotensive effect. However, further investigation is required to identify the active principles responsible for antihypertensive activity.

INTRODUCTION

Hypertension (HT) is a most common cardiovascular disease in developed and developing countries. Due to changes in the man behaviour and life style currently one of the major risk factors for coronary artery disease, cardiac failure, insulin resistance, obesity, strokes, atherosclerosis and renal insufficiency. Many studies have reported diets high in carbohydrates, particularly sugars and even more particularly sucrose and fructose increase the risk of cardiovascular diseases including high blood pressure [1]. A number of scientific reports tend to support the fact some metabolic abnormalities such as hyperinsulinemia, insulin resistance and hypertriglyceridemia as well as hyperactivity of the sympathetic nervous system and oxidative stress were frequently associated with the pathogenesis of sucrose induced hypertension [2]. It is well known that high blood pressure can often lead to dangerous complications if left untreated [3, 4]. In developed countries, 10% or more of the total health budget is spent on the management of hypertension, diabetes and its complications.

Many synthetic drugs due to their side effects, people largely use herbal medicine because of easily availability, cost effectiveness to prevent and cure illness [5] for curiosity and also the idea that combining it with conventional treatment would help [6]. A holistic or a spiritual health concern and the belief that herbal drugs are natural (and thus safe) also seem to be associated with the use of alternative medicine [7]. Traditionally, many of the folk remedies of plant origin have long been used for the treatment of various ailments unscientifically exploited or improperly used. Therefore, there is an urgent need to develop new and effective drugs for the treatment of hypertension, can be used as a single plant or in polyherbal formulations.

The genus *Salix* comprises about 500 species that mainly distributed in temperate region worldwide and also in higher altitudes of tropics. The species are rich in phenolic constituents such as

salicylates, flavonoids and tannins that have many pharmacological activities and medicinal uses. Information provided by traditional medical practitioners in the Western Ghats indicates that the leaf of *Salix tetrasperma* Roxburgh is used to treat diabetic and hypertension. However, there is a lack of sufficient scientific data justifying the traditional use of *Salix tetrasperma* Roxburgh in the treatment of hypertension. Hence, there is an increasing need of new natural antihypertensive agent with less adverse effects; safe and easily available can be used alone or in polyherbal formulations. So the present investigations was undertaken to determine the effects of the ethanolic and aqueous extract resulting in antihypertensive activity in fructose induced hypertension in rats.

MATERIALS AND METHODS

Hypertension was induced in rats by feeding them a fructose (10%) diet for 21 d instead of tap water. Antihypertensive effect of *Salix tetrasperma* Roxburgh was evaluated by observing the degree of lowering of blood pressure in fructose induced hypertensive rats.

Plant material

The leaves of *Salix tetrasperma* Roxburgh were collected from the Bommalapura village of Kappa taluk, Chikmagalur district of Karnataka and were authenticated by Dr. E. Kumara Swamy Udapa, Professor and H. O. D Dept. of Botany S. J. C. B. M. College Sringeri, Karnataka. A voucher specimen (NCP/15/2010-11) has been deposited at Pharmacognosy department for further reference.

Preparation of the extracts

The leaves of *Salix tetrasperma* Roxburgh were cleaned and dried under shade at room temperature for several days and coarsely powdered. Dried powder was subjected to successive extracted in soxhlet extractor as per standard procedure using petroleum ether (40-60 °C) and ethanol at their boiling point for 48 h. The marc

ABSTRACT

Benzothiazepines are synthesized by conventional synthesis metho. The compounds have been screened for Cytotoxic activity. Tested compounds were prepared by the reactions between 1,3-diarylprop-2-enones with orthoamino thio phenol. All the products were tested for purity by TLC and charecterised by elemental analysis and different spectroscopic methods.

KEYWORDS: 2-fluoroacetophenone, Benzothiazepine, 2-Aminothiophenol, piperidine.

INTRODUCTION

The benzothiazepines are important nitrogen- and sulfur-containing seven-membered heterocyclic compounds in drug research since they possess diverse bioactivities. Benzothiazepines are the most wellknown representatives of benzologs of 1, 4-thiazepine and one of the three possible benzo-condensed derivatives, viz. 1,4-and 1,5-benzothiazepines. The benzothiazepine derivatives are of particular interest for lead discovery because they have been found active against different families of targets. The first molecule of benzothiazepine used clinically was diltiazem, followed by clentiazem, for their cardiovascular action. Therefore, the benzothiazepines are useful compounds in the drug research which has stimulated the invention of a wide range of synthetic methods for their preparation and chemical transformations.^[25-45]

MATERIALS AND METHODS

Procedure for Synthesis of 1, 5-Benzothiazepines

Chalcones of 2-FluoroAcetophenone (1 mill mole) and O-Amino thiophenol (1 mill mole) was dissolved in 10 ml of boiling methanol the heat was removed and piperidine (2 drops) was added. After the mixture had cooled to room temperature the additional 10 ml of methanol was added and heated until the slurry was dissolved. Then add 1 ml of Glacial acetic acid and allow the mixture at 250C for overnight. The yellow color crystals benzothiazepine was separated out. This was recrystallised with methanol and filtered. The scheme and physical characterization data will be given below.

ABSTRACT

The present study is carried out to investigate the anti-inflammatory potential of Methanolic extract of *Basella alba* (BA). Anti-inflammatory activity was evaluated by using Egg Albumin, Turpentine Oil & Formaldehyde as phlogistic agents. The animals were treated with doses 250mg/kg and 500mg/kg of extract and Diclofenac Sodium at a dose of 10mg/kg is used as a standard drug. The BA showed a significant anti-inflammatory activity in a dose dependent manner in all the models when compared with the standard treatment. The extract (500mg/kg) exhibited maximum antiinflammatory activity i.e., 46.26%, 44.34%, 46.38% ($P < 0.001$) like standard Diclofenac 47.03%, 46.54%, 48.55% in Egg albumin, Turpentine oil and Formaldehyde induced methods respectively. Based on the above results, we conclude that the BA has significant anti-inflammatory activity and might prove efficacious for further design and development of agents with significant biological activity.

KEYWORDS: *Basella alba*, anti-inflammatory activity, phlogistic agents.

INTRODUCTION

Herbal therapy is also known as herbalism, which play a major role in treatment of so many diseases in so many countries & in traditions.^[1] Inflammation is a complex process, which is frequently associated with pain and involves occurrences such as: the increase of vascular permeability, increase of protein denaturation and membrane alteration. When tissue cells become injured they release kinins, prostroglandins and histamine.^[2] Rheumatoid arthritis a ravaging disease is a major public health burden in about 1% of the population worldwide. As the currently used drugs are associated with severe side effects, the urge to develop new chemical entities with potent biological activity from natural sources with lesser side effects has become mandatory. Traditional medicine using plant extracts continue to provide health coverage for over 80% of the world's population especially in developing countries.^[3] Many medicinal plants have been investigated for novel drugs or templates for the development of new therapeutic agents.^[4] Various species from the genus *alba* have been reported to possess anti-inflammatory activity.

The childhood arthritis is the fifth most common chronic disease of the childhood and the most common of the paediatric rheumatic disease, affecting as many people in America. Despite of the use of the conventional methods

in pain management ,persistent pain continuous to be predominant problem in children.^[5] The aim of the present study is to identify the identify the anti inflammatory activity of the plant extract in animal models. to identify the better molecule which useful to human use.

Basella alba (Telugu: *bachhali* ; Family: *Basellaceae*) is a vine spinach, leaves are thick, rugose, succulent and green to purple colour. *Basella Alba* is advantageous for treating Ulcers and Abscesses, Rheumatic pain and Swellings.^[6] Medicinal plants contain numerous biologically active compounds such as carbohydrates, proteins, enzymes, fats and oils, vitamins, alkaloids, quinines, terpenoids, flavonoids, carotenoids, sterols, simple phenolic glycosides, tannins, saponins, polyphenols etc. *Basella alba* contains Vitamin A, Vitamin E, Vitamin K, flavonoids, saponins and β -Carotene. The plant is reported to treat against laxative, rubefacient, skin diseases, burns, ulcers, diarrhoea, diuretic^[7] and cancer. The present study was under taken to evaluate anti inflammatory activities of Methanolic leaf extract of *Basella alba*.

MATERIALS AND METHODS

Collection of plant material & Extraction: The leaves of Malabar spinach were collected from surrounding

ABSTRACT

Quality management is a boom in Indian pharmaceutical area and is one such approach along with government regulatory requirements. TQM improves quality and performance in pharmaceutical products and meet customer expectations. The objective of TQM meets important goals of the industry. Quality control, good manufacturing practice and quality assurance assures quality, safety and efficacy of the drug products. TQM leads to organization success and helps in reaching organization objectives. TQM prevents defects in pharmaceutical products and reduces the wastage of raw materials.

KEYWORDS: GMP, Quality control, Quality assurance, Pharmaceutical products.

INTRODUCTION

An effective quality assurance policy with defined mission and objectives is the most important goal of pharmaceutical industry. The concept of quality assurance and quality control together develops towards assuring the quality, safety and efficacy of pharmaceutical products. Thus, quality is critically important ingredient to organizational success today, which can be achieved by total-quality management (TQM), an organizational approach that focuses on quality as an over arching goal, aimed at the prevention of defects rather than detection of defects. Present work attempts to furnish a wide overview of the TQM concept and the management means leading to quality improvement of pharmaceuticals.

The maintenance of quality with continuous improvement in facilities is very important in pharmaceutical industries. The pursuit of quality being approached through the concept of total quality management (TQM) system which is aimed at prevention of defects rather than detection of defects. Total quality management is a management system for a customer oriented organization that involves all employees in continual improvement of all aspects of the organization. TQM uses strategy, data, and effective communication to integrate the quality principles into the culture and activities of the organization. TQM functions on the introduction of quality of products and process is the responsibility of everyone who is involved with the creation or consumption of the products or services offered by an organization. TQM capitalizes on the involvement of management, workforce, suppliers and

even customers, in order to meet or exceed customer expectations. The nine common TQM practices are cross-functional product design, process management, supplier quality management, customer involvement, information and feedback, committed leadership, strategic planning, cross-functional training and employee involvement.

To be effective in improving quality, TQM must be supported at all levels of a firm, from the highest executive to the lowest-level hourly employee. TQM extends the definition of quality to all functional areas of the organization, including production, marketing, finance, and information systems. The process begins by listening to customers' wants and needs and then delivering goods and services that fulfill these desires. TQM even expands the definition of customer to include any person inside or outside the company to whom an employee passes his or her work. This notion encourages each member of the organization to stay focused on quality and remain fully aware of his or her contribution to it and responsibility for it. The TQM philosophy focuses on teamwork, increasing customer satisfaction, lowering costs, and implementing quality at all levels. Organizations implement TQM by encouraging managers and employees to collaborate across functions and departments, as well as with customers and suppliers, to identify areas for improvement, no matter how small or big. Teams of workers are trained and empowered to make decisions that help their organization achieve high standards of quality. Organizations shift responsibility for quality control from specialized departments to all employees. Thus,

Total quality management practices in pharmaceutical industry: A study of selected companies in Andhra Pradesh and Telangana states

¹ K Vijay Kumar, ² Dr. R Sivaram Prasad

¹ Assistant Professor, Dept. of Regulatory affairs, Chalapathi Institute of Pharmaceutical Sciences, Guntur Andhra Pradesh, India

² Research Director, Acharya Nagaruna University, Guntur, Andhra Pradesh, India

Abstract

Total Quality Management (TQM) is a management approach for an organization centred on quality, based on the participation of all its members and aiming at long term success through customer satisfaction and benefits to all members of the organization and to society. This research work therefore aimed at assessing the TQM practices and its effect on organizational performance in Selected pharmaceutical industries in AP and Telangana states. The company needs to find ways to surviving in the increasing competitive market and TQM as a strategic Management tool can be used for improving the competitiveness, effectiveness and flexibility of the whole organization. A population of 1200 workers from different pharmaceutical industries comprising both senior and junior staff was used for the study. Primary data for this research was collected using a well designed and structured questionnaire which was made up of both close ended and open ended questions. The key findings showed that selected pharmaceutical industries is practicing TQM but it is yet to implement it to the highest level of subscribing to a quality award system. The implementation of TQM is at the quality assurance level. It was found out that management inactions undermined leadership commitment to quality and rendered TQM practices ineffective. It was concluded that there was the need to procure modern equipment to boost production. Again the firm needs to diversify key portfolio in order to spread the overhead cost. Management must work to build trust amongst staff to improve on team work. It is also recommended that the company subscribe to a quality award system. For instance ISO certification can help selected pharmaceutical industries practice TQM to the highest level to ensure customer confidence in the company's products.

Keywords: TQM, pharmaceutical company, GMP, ISO

1. Introduction

Any organization in any line of business requires a quality management program or some sort of quality program that is instituted from executive management down to the lowest level employee. While each particular function within an organization requires quality processes modelled after its own unique requirements, this individual quality processes should be designed and established based on the principles of the overall quality management program. One of such quality programmes is Total Quality Management (TQM). Total Quality Management (TQM) has been defined as an integrated organizational effort designed to improve quality at every level (Dale, 1999). TQM is also defined as a quest for excellence, fitness for use, value for money, customer satisfaction etc (Mohanty and Lakhe, 1994). The International Organization for Standards (ISO) defines TQM as, —a management approach for an organization, centred on quality, based on the participation of all its members and aiming at long term success through customer satisfaction and benefits to all members of the organization and to society (ISO8402:1994). TQM as noted by Oakland (1993) as a strategic management tool that can be used for improving the competitiveness, effectiveness and flexibility of the whole organization. The concept of quality has existed for many years, though its meaning has changed and evolved over time. In the early twentieth century, quality management in

inspecting products to ensure that they met specifications. In the 1940s, during World War II, quality became more statistical in nature. Statistical sampling techniques were used to evaluate quality and quality control charts were used to monitor the production process. In the 1960s, with the help of so-called —quality gurus, the concept took on a broader meaning. Quality began to be viewed as something that encompassed the entire organization, not only the production process. Since all functions were responsible for product quality and all shared the costs of poor quality, quality was seen as a concept that affected the entire organization (Dhalla, 2010).

Total Quality Management (TQM) is a management approach for an organization centred on quality, based on the participation of all its members and aiming at long term success through customer satisfaction and benefits to all members of the organization and to society. This research work therefore aimed at assessing the TQM practices and its effect on organizational performance in different pharmaceutical companies. The company needs to find ways to surviving in the increasing competitive market and TQM as a strategic Management tool can be used for improving the competitiveness, effectiveness and flexibility of the whole organization. A population of 1200 workers from different pharmaceutical companies comprising both senior and junior staff was used for the study. Primary data for this research was

ABSTRACT

Diabetes is a major public health concern associated with huge economic burden in developing countries. According to Diabetes Atlas published by the International Diabetes Federation (IDF), there were an estimated 40 million persons with diabetes in India in 2007 and this number is predicted to rise to almost 70 million people by 2025, the economic burden due to diabetes in India is amongst the highest in the world. This study aimed to assess the direct costs involved in treating long-term diabetic complications among hospitalized patients with type 2 diabetes. A total of 253 patients were recognized and are divided into groups based on the presence of complications. Details on socio-

demography, hospitalization, direct costs of all patient care were recorded. The data on expenditure was obtained from hospital bills. A comparison was made for estimating cost involved in treating pt with and without complications. Based on the results obtained the expenditure for hospital admissions was higher for patients with foot and cardiovascular complications and it was highest if they had presence of two complications. Hence this study emphasizes the importance of minimizing burden on the patients for achieving better outcome therapeutically as well as economically.

ABSTRACT

The quality in the pharmaceutical industry has become a very important topic. Pharmaceutical industry has been emerging rapidly for the last decade by focusing on product Quality, Safety, and Efficacy. The guidelines of ICH from Q8 to Q11 have discussed QbD implementation in pharmaceutical product formulation development. ICH Q11 is a clear discussion about QbD approach for API (Active Pharmaceutical Ingredient) synthesis with examples. Pharmaceutical firms increased the number of product development by using different scientific tools such as QbD (Quality by Design) and PAT (Process Analytical Technology). The main key tools of AQbD are identification of ATP (Analytical Target Profile), CQA (Critical Quality Attributes) with risk assessment, Method Optimization and Development with DoE, MODR (method operable design region), Control Strategy, AQbD Method Validation, and Continuous Method Monitoring (CMM), TQM (Total Quality Management), DOE (Design of Experiments). Implementation of AQbD simultaneously in analytical development will improve the ability of production of high quality products which will minimize the risks during every step of manufacturing and analysis of products.

ABSTRACT

The application of quality by design (QbD) in pharmaceutical product development is now a thrust area for the regulatory authorities and the pharmaceutical industry. International Conference on Harmonization and United States Food and Drug Administration (USFDA) emphasized the principles and applications of QbD in pharmaceutical development in their guidance for the industry. The key elements of QbD viz., target product quality profile, critical quality attributes, risk assessments, design space, control strategy, product lifecycle management, and continual improvement are discussed to understand the performance of dosage forms within design space. Design of experiments, risk assessment tools, and process analytical technology are also discussed for their role in QbD. This review underlines the importance of QbD in inculcating science-based approach in pharmaceutical product development.

Keywords: Design of experiments, design space, process analytical technology, risk assessment, Quality by Design (QbD), Critical Quality Attribute (CQA), Quality Target Product Profile (QTPP), Failure Mode Effects Analysis (FMEA), Failure Mode, Effects and Criticality Analysis (FMECA), Fault Tree Analysis (FTA), Hazard Analysis and Critical Control Points (HACCP).

INTRODUCTION

The annex of International Conference on Harmonization (ICH), ICH Q8 (R2) guidance,^{1,2} describes the principles of quality by design (QbD). This guidance further clarifies the key concepts mentioned in the parent guidance ICH Q8³. It defines quality as "the suitability of either a drug substance or drug product for its intended use." ICH Q8 (R2) defines QbD as "a systematic approach to development that begins with predefined objectives and emphasizes product and process understanding and process control, based on sound science and quality risk management." The concept and application of the principles of QbD has been an emerging topic in the pharmaceutical industry.⁴ In QbD, the product quality is assured by understanding and controlling formulation and manufacturing variables. Thus, the consistent product quality results from the design, control of formulation, and the manufacturing process. This article

focuses on the application of QbD for pharmaceutical product development. Application of QbD approach in pharmaceutical product development can lead to robust formulations and high success rate in regulatory approvals. QbD involves the use of multivariate statistics and design of experiments technique⁵. QbD involves a thorough understanding of the relationship of product performance with product attribute and process^{6, 7}. Traditionally, formulations are manufactured to meet quality control tests outlined in product specifications. If the product is deemed fit for commercial purpose, then it should meet quality control tests. In case of a batch failing to comply with these tests, it is reprocessed or rejected which opens doors for regulatory questions and obvious cost burden. The application of QbD in pharmaceutical product development is systematic, involving multivariate experiments utilizing process analytical technology (PAT) and

PREVALENCE OF OTC MEDICATIONS IN RURAL AREAS - AN EPIDEMIOLOGICAL SURVEY REPORTB. Srinivas Teja^{*1}, V. Brahma Naidu², R. Venkateswar Rao¹, N.V. Article Revised on 21/02/2017

Article Accepted on 14/03/2017

ABSTRACT

Medication, when it is used properly, it may cure the problem, but when misused it may create a new problem. Prevalence rate of Drug related problems are more common in our country. Due to many reasons, this Drug related problems create excess burden on patient's health. Adherence to OTC medication has gained momentum in our community, which is the major concern to health care.

KEYWORDS: over the counter drugs, rural population, medication adherence.

INTRODUCTION

Self-medication is the use of drugs with therapeutic intent but without professional advice or prescription. Medication abuse is a common problem which may create an excess burden on the patient as well as the whole health care system. Medication abuse can be promoted majorly in OTC Counters in many of the Developing countries. It has also been defined as the use of nonprescription medicines by people on their own initiative.^[1] Drugs that are prone to self-medication include analgesics, antimalarials, antibiotics and cough syrups, among others.^[2] Self-medication with antibiotics occur in many developing countries where drugs are not well-regulated. Hence there is easier access to prescription or over-the-counter medicines without prescription. Self-medication, could cause bacteria resistance to such antibiotics and may precipitate the emergence of multiple resistant organisms that would be difficult to treat and this has caused increased morbidity.^[3-6] Perception of illness and incessant advertising, among others, have increased the prevalence of self-medication which accounts for about 2.9 - 3.7% causes of death in hospitals as a result of drug-drug interactions.^[7-13] It has also been reported that drug use is influenced by the sociodemographic characteristics of drug consumers such as gender, morbidity, age, attitudes about life and health, stress and social roles but has nothing to do with education and ethnicity.^[14-16] Some of the problems associated with self-medication such as masked diagnoses, use of excessive drug dosage, prolonged duration of use, drug interactions, polypharmacy and superinfection can occur in self-medicating individuals. However, there is substantial variation in the prevalence rates of self medication among developing and developed nations due to inherent

differences in cultural and socioeconomic factors, disparities in health care systems such as reimbursement policies, access to health care and drug dispensing policies.^[17]

MATERIALS AND METHODS

The study was conducted in rural areas of Guntur district for a period of 3 months. Individuals willing to participate and give their informed consent were included in the study and individuals who are not meeting the study criteria were excluded from the study. Overall 3167 participants were involved in the study, and over 821 families have been included. We have assessed the patient's dependence on OTC medication by using a standard questionnaire method. After collecting the data from the participants, it was sent to the interpretation of results by using Statistical Analysis.

RESULTS**Most commonly misused drugs**

ABSTRACT

OTC refers to consuming drugs without the advice of a physician either for diagnosis, prescription or surveillance of treatment. It always has been a part of normal practice in human life from the ancient times. In developing countries like India, there are an increased proportion of drugs used as self medication compared to prescribed drugs. The study aimed to assess and categorize the usage of OTC medications in rural area in Guntur. A prospective study was conducted in the community setting for duration of 6 months and subjects were recruited based on inclusion and exclusion criteria. A total of 252 subjects were enrolled and relevant data was collected and assessed. Majority of the subjects were using OTC product to get relief from symptoms of fever and their preferred system of medicine was allopathy, reason was found to be economic problem. This study emphasizes that self medication must be correctly taught and controlled and there is an alarming need for promoting appropriate usage of medications in health care system.

INTRODUCTION

Self-medication it is defined as "obtaining and consuming drugs without the advice of a physician either for diagnosis, prescription or surveillance of treatment."^[1] The word self medication history (WSMI) defines self-medication as the treatment of common health problem with medicines especially designed a labeled for use without medical supervision and approved as safe and effective for such use. According to WHO definition (1998), self medication is the "selection and use of medicines by individual to treat self recognized illness or symptoms".^[2]

However, the practice of self medication can rather frequently have adverse effects, it can generate an additional burden on the system and increase counterproductive out of the pocket expenditure in already impoverished population. Self medication has always been a part of normal practice in human life from the ancient times. Advertisements on television, news papers and other pharmaceutical publications have improved the rate of self medication. In developing countries like India, easy availability of wide range of drugs coupled with inadequate health services resulted increased proportions of drugs used as self medication compare to prescribed drugs.

In developing countries, cold, cough were the most common reasons for non doctor prescription most of these illnesses are treated by self-medication. Antipyretics and analgesics were the most commonly used class of drugs for self-medication. Followed by them are drugs used for treatment of cold, and cough and the anti-microbial. Trend was observed towards homeopathic and ayurvedic system of medicines for chronic illness like joint pains, bronchial asthma, obesity, baldness, more over herbs and homeopathic drugs were considered safe and free from adverse effects, but the risk of possible drug interactions is always with their use. The pharmacist has a multifaceted role to play in facilitating self medication in the society. He has to be a communicator, quality drug supplier, trainer and supervisor, collaborator, health promoter. Pharmacists have a professional responsibility to provide sound, unbiased advice and to ensure that self medication is reported to only when it is safe and appropriate to do so. The pharmacist is ideally qualified and placed to advice on the need to consult a prescriber and that advice given by a friend or member of that person's family. Pharmacists have the necessary knowledge to advice on safe storage of medicines in the home and on safe disposal of medicines once a course of treatment has been completed or, in case of a medicine, which is obtained for occasional use, when the expiry date has been reached. Pharmacists can also advise that medicines

Intervention.

ABSTRACT

Pharmacist traditionally involving compounding, production and dispensing of drugs from ancient times. As the diseases and sedentary life style leads to complications to use of more medications to manage the disease and life style problems, this is the time to identify the unsafe and irrationalize medicine medical therapy has emerged. This has also contributed to clinical pharmacists being more involved in patient-centered pharmacotherapy. A large literature documents the multiple roles clinical pharmacists can play in a variety of health care settings. The main aim of the study is role of clinical pharmacist in modifying disease outcome by patient centered care in the medical wards. Clinical pharmacist role between physician and patient to provide drug information, economic benefits, patient compliance, drug related problems (DRP), to determine the effect of patient counseling on quality of life of patient. **METHODOLOGY-** The prospective observational study to conducts for a period of two and half years about 30 months in patient departments in a tertiary care hospital in South India. promoting better medication use, ensuring that patients receive appropriate pharmacotherapy, thus minimizing the risk of unfavorable outcomes of pharmacotherapy adherence scale. **RESULTS & DISCUSSION-** A total of 1263 patients out of 6548 inpatients of general medicine department were followed out of which having one or more drug related problems. Female (56.7%) [Table-22] predominance was noted over males (43.3%). Drug related problems were more commonly seen in patients aged between 41-60 years, (47.92 %). A total of 240 drug related problems were identified. Most of the DRP observed in the study resulted from the inappropriate drug dosing problems (25.42%) followed by drug selection (24.16%)[Table-23]. Majority of the clinical pharmacist recommendations were on drug discontinuation (29.58%) and drug doses change (22.6%). **CONCLUSION-** The study concludes that involving clinical pharmacist services in patients care can significantly helps to identify, resolve and prevent the DRPs in the hospital thereby enhancing the patient's outcomes. Furthermore, the suggestions provided by the clinical pharmacist during the intervention were well accepted by the physician thus the collaborative approach of physician and clinical pharmacist can provide better patients centre care outcomes. The study stresses the importance of clinical pharmacist in health care sector and impeccable role in patients care.

ABSTRACT

AIMS: The main Aim of the study is to evaluate the impact of clinical pharmacist care in improving glycemic control, HRQOL, medication adherence in type 2 Diabetes mellitus patients. **METHODS:** The study is conducted in government general hospital, Guntur, a territory care hospital and it is a prospective comparative observational study including 100 subjects with type 2 diabetes mellitus out of these 50 were randomly assigned in to test group and 50 in to the control group. **RESULTS:** By observing the data, glycaemic control in the test population is clearly improved with a mean difference of -57.18 and p value of < 0.0001 i.e., extremely significant when compared to the control population with a mean difference of -7.68 and p value of 0.8694 i.e., nil significant. There is better glycaemic control with respect to the HbA1c levels in the test population with a mean difference of 1.8 and p value of < 0.0001 i.e., extremely significant than the control population with a mean difference of 7.68 and p value of 0.216 i.e., nil significant. There is a predominant improvement in quality of life of test population with a mean difference in QOL score 32.81 ± 0.9045 and p value < 0.0001 i.e., statistically extremely significant when compared to the control percentage score with a mean difference of 7.647 ± 1.545 and p value < 0.01 i.e., statistically significant. There is major increase in medication adherence in the test group with a mean difference of 4.3 ± 0.603 and p value < 0.0001 i.e., extremely significant when compared to the control with a mean difference of 1.2 ± 0.15 and p value < 0.549 which is statistically nil significant. **CONCLUSION:** The study provide information regarding impact of glycemic control on QOL and medication adherence in type 2 DM patients. We conclude that clinical pharmacist together with physician play a major role in improving the glycaemic control and medication adherence in type 2 DM patients which directly shows impact on health related quality of life.

Clinical Pharmacist,

Counselling,

Disease Prevention.

ABSTRACT

Background: The major ailments that command our attention today are Heart diseases, Stroke, Diabetes, AIDS, Cancer and mental disorders and, these are the object of our fears. While the physical symptoms are the leading reason for outpatient visits, a substantial proportion of physical complaints and minor illnesses remain poorly understood. Data shows that OPD visits for non-specific (62million) is more than for the known chronic ailments (17million) ⁽¹⁾. The purpose of our study was to determine the prevalence of symptoms and diseases in outpatient departments of general medicine in a tertiary care hospital. AIM – To Study the disease profiles in 2000 patients attending to outpatient departments of General medicine Government General Hospital, Guntur: A Clinical Pharmacist's opinion, between Februarys to June 2016. OBJECTIVE: To identify the prevalence and incidence of symptoms, diseases in common population. METHOD: The present study was a Non experimental prospective study conducted at Government General Hospital, Guntur during the period from February to June 2016. Patients attending the general medicine department with age >15 years, Patient's demographic data were collected and evaluated. The collected data was analysed. RESULTS: In this study a 2000 patient data was collected and compiled in which minor illnesses account for 51.25% of the problems, which include Headache, Acid peptic disease, Myalgia's, Fever etc. in the order of presentation. The major illnesses which include Diabetes Mellitus, Hypertension, Gastritis, Cerebrovascular accident, etc. accounts for 33.60%. 15.15% diseases account for rare illnesses related to different systems which include Gastrointestinal, Respiratory and Central Nervous System. CONCLUSION: Minor ailments are predominantly seen than major diseases in Out-patient visits, because patients who participated in this study are from low socio economic status who lack knowledge about health care measures, so clinical pharmacists can provide counselling to patients about their dietary habits, personal hygiene, and disease prevention modalities and most importantly about their medications and side effects can reduce the morbidity.

ABSTRACT

The emergence of antibiotic resistant bacteria is major problem throughout the world and rational use of antibiotics is therefore very important. Good infection control practice is a critical component for success of such programme. This six months prospective observational study was designed to evaluate the appropriateness of antibiotic use in a secondary care referral hospital of South India. The data of all in patients (n=100) were collected by obtaining a proper consent. Maximum of 52.78% patients had culture sensitivity test being done, which may taken as a indication for being rational. The results revealed that the purpose of antibiotics prescribed was for prophylaxis (15%), empirically (37%) and therapeutically 48%. In the study population (n=49) (patients had shown a positive culture study reports for urine, sputum, pus and blood samples), totally 110 antibiotics were prescribed, 71.88% on dual therapy and 28.12% were on three antibiotics and the mean number of antibiotics prescribed was 2.28. In the overall population, 61.65% were administrated intravenously and 39.35% of oral antibiotics. The major organisms identified were E.coli (28.90%) and amikacin had shown the highest sensitivity in E.coli (86.4%). Totally 31 drugs of antibacterials were listed in National List of Essential Medicine. Out of 31, 15 antibacterials were prescribed in study population.

Levothyroxine,
Dose Adjustments,
Thyrotropin.

ABSTRACT

BACK GROUND: Hypothyroidism (underactive thyroid) is a condition in which thyroid gland doesn't produce enough of thyroid hormone. Women, are more likely to have hypothyroidism, as it is chronic illness, lifelong therapy with levothyroxine is necessary. The dose should be individualized in the hypothyroidism patients on the basis of clinical response and biochemical tests. Regular monitoring of TSH and thyroxine is recommended when starting therapy or changing the dose. **AIM AND OBJECTIVES:** (i) To evaluate the dosage adjustment of levothyroxine in patients with hypothyroidism and with coronary artery disease. (ii) To assess the serum TSH, serum T3 and serum T4 levels in patients with hypothyroidism. (iii) To monitor the levothyroxine therapy related side effects and dosage adjustments. (iv) To improve patients quality of life. **METHODS:** The study was conducted in Government General Hospital, Guntur, a tertiary care teaching hospital. The sources of data will include the relevant data cards of the patient along with direct observation of the patient. Family history of the patient and risk factors if any are also included. Dose adjustments was done to the subjects included in the study and management parameters are collected. **RESULTS:** We reviewed the following therapeutic categories in the total of 100 subjects 3% of subjects are at the risk of developing coronary artery disease and dosage adjustment was done in 72 subjects and remaining 28 subject's does not require the adjustment. 15% were under replaced and 5% were over replaced. **CONCLUSION:** We concluded that levothyroxine should remain the standard of care for treating hypothyroidism. Thyroid hormone therapy should be initiated as an initial full replacement or as partial replacement with gradual increments in the dose titrated upward using serum thyrotropin as the goal. Dose adjustments should be made with thyrotropin assessment 4–6 weeks after any dosage change. Additional research is also needed to develop thyroid hormone analogs with a favorable benefit to risk profile.

ABSTRACT

Background:

The aim of this study is to evaluate drug utilization in preeclampsia and eclampsia.

Methods:

A prospective observational study was conducted by department of pharmacy practice in collaboration with the Department of Obstetrics in A Tertiary Care Teaching Hospital, Guntur. After taking permission from the Institutional Review Board. WHO basic indicators were used for studying the prescribing pattern of drugs.

Results:

Out of the total prescriptions studied the most commonly prescribed antihypertensive was nifedipine, followed by labetalol and Magnesium sulphate. Majority drugs prescribed were from category B and C. Single drug therapy was prescribed in 70% patients. The use of fixed dose combinations was low.

Conclusion:

The incidence of single drugs therapy and two drugs was high. Irrational prescriptions were few. The present pattern of prescriptions can be improved by advocating rational drug prescription and awareness regarding safe use of drugs to the obstetricians.

 Psychoeducation,
 Depression,
 Attitudes and Beliefs.

ABSTRACT

The aim of the study was to provide psychoeducation for changing the attitudes and beliefs of patients with unipolar depression towards antidepressant treatment. The study was a prospective, comparative, randomized, interventional study conducted at psychiatry Out-patient Department in a Tertiary Care Hospital, Guntur which includes 89 patients with unipolar depression. Those patients who are receiving psychoeducation along with antidepressant treatment are randomized into study group where as those patients only on antidepressant therapy are grouped as control. The data was collected through Antidepressant Compliance Questionnaire at base level and after 2 months, where the study group received 3 sessions of psychoeducation with 15 days time interval between each session. Among 89 patients who participated in study, 08 could not be followed up in the study, hence dropped out. Out of 81 patients 38.2% were male and 61.7% were female. Majority of patients 44.4% were in the age group between 40 to 50 years and 87.6% of patients with 10th and below 10th educational status were found to have depression. Patient doctor relationship (Component 1 of ADCQ) had correlation of ($r=0.68$, $p=0.0001$) and have positive correlation with follow up ($r=0.76$, $p=0.0001$). The correlation is not significant at $p=0.05$. Correlation between positive belief on antidepressant (Component 3 of ADCQ) and follow up scores after psychoeducation ($r=0.999$, $p=0.0001$) which is significant at $p=0.01$. Correlation between partner's agreement (Component 4 of ADCQ) and follow up scores after psychoeducation ($r=0.96$, $p=0.009$) which is significant at $p=0.05$. By this we conclude that psychoeducation improves the attitudes and beliefs of the patients with unipolar depression towards antidepressants and its main outcome is based on the patient doctor relationship where the sufficient time should be spent on the patient towards their feelings.

Key words:

Insomnia, sleep hygiene education,
Clinical Pharmacist, Pittsburgh sleep
quality index scale.

ABSTRACT

Background: Insomnia is defined as the complaint of difficulty falling asleep, staying asleep or no restorative sleep. DSM-IV criteria for primary insomnia if the duration is >1month. It causes clinically significant distress or impairment. It does not occur exclusively during the course of mental disorder. Insomnia is the most commonly observed in co-morbid patients with psychiatric conditions.

Aim: To improve quality of sleep in psychiatric patients with sleep disturbances by providing non-pharmacological support to the patients attending psychiatry.

Objectives:

- To avoid and minimize drug dependence by following non-pharmacological treatment.
- To improve quality of sleep non-pharmacologically

Method: A cross-sectional study was conducted in government general hospital, Guntur. It was approved by the Ethical committee. The quality of sleep is assessed using PSQI scale for a period of 6 months i.e. of December, 2016 to May, 2017.

Results: They were analysed using graphpad prism and graphpad instat. A total number of 60 patients, males were 33(58%) and females were 24(42%). From our data, 47% of psychosis patients were observed with sleep disturbances. The level of significance of p-value 0.005 shows the improvement in sleep quality was assessed by using PSQI scale after follow-up.

Conclusion: SHE can be used as a supportive therapy for patients who do not need sedatives in psychiatric disorders compared to pre-follow up there was significant improvement in quality of sleep at post-follow up. Clinical pharmacist has a major role in the management of psychiatric disorders by monitoring ADRs, Drug interactions and improving patient related quality of life.

INTRODUCTION

Insomnia is the most commonly observed in co-morbid patients with psychiatric conditions. It is defined by the presence of an individual's report of difficulty with sleep.

Insomnia is defined as the complaint of difficulty falling asleep, staying asleep or non-restorative sleep^[1]. DSM-IV criteria for primary insomnia if the duration is >1month. It causes clinically significant distress or impairment. It does not occur exclusively during the course of a mental disorder. It is not due to another medical or sleep disorder or effects of medication or substance abuse.

Types of Sleep Disorders According To DSM-IV-TR

Primary sleep disorders

- Dysomnias
- Parasomnias

Secondary sleep disorders

- Sleep disorder related to another mental disorder
- Sleep disorder due to a general medical condition
- Substance induced sleep disorder^[2]

Sleep Requirements and Quantity of Sleep

Sleep is a natural state of the body as the optimal amount of sleep is required to remain alert and fully awake and to function properly.

Accepted 14th November, 2017

Published online 28th December, 2017

Key words:

Anti-epileptics, childhood epilepsy, drug related problems and patient information leaflet

ABSTRACT

Background: Worldwide, up to 80 million people are suffering with epilepsy, of whom 10.5 million are children <15 years. The lifetime likelihood of experiencing at least 1 epileptic seizure is about 9%. Because of common occurrence of epilepsy, the narrow therapeutic index and safety margins of antiepileptic medications, and the recognized side effects of medications, in children with epilepsy is imperative. This study reviews the usage pattern and side effects to the anti-epileptics in children. Appropriate usage pattern of antiepileptic drugs in childhood epilepsy is essential to improve quality of life in these children.

Aim: To study the pattern of usage and side effects to anti-epileptic drugs in pediatric patients.

Objectives:

1. To study the prescribing pattern of anti epileptic drugs
2. To identify the side effects experienced by the pediatric patients

Methodology: The study was conducted in Government General Hospital, Guntur, a tertiary care teaching hospital. The sources of data included were relevant medical records of the patient along with direct observation of the patient. Socio-demographics of the patient, anti-epileptic drugs prescribing pattern, associated drug related problems and adherence were considered during the process of data collection.

Results: During the study period, 148 subjects of either sex were enrolled. In this 34 of the 148 children (22.9 %) were on multiple AED; 31(20.9) were on dual therapy while 3(2%) were on triple therapy. The most common drug combination was Valproic acid (VPA) and Phenytoin (PHT) followed by VPA and Clobazam.

Conclusion: Sodium valproate was the most commonly prescribed drug. Major side effects reported were with sodium valproate (somnolence, weight gain, nocturnal enuresis.)

INTRODUCTION

Epilepsy is a disease of the brain defined by any of the following conditions

1. A least two unprovoked (or reflex) seizures occurring >24 h apart
2. One unprovoked (or reflex) seizure and a probability of further seizures similar to the general recurrence risk (at least 60%) after two unprovoked seizures, occurring over the next 10 years
3. Diagnosis of an epilepsy syndrome

Epilepsy is considered to be resolved for individuals who had an age-dependent epilepsy syndrome but are now past the applicable age or those who have remained seizure-free for the last 10 years, with no seizure medicines for the last 5 years. (1)

*Corresponding author: Mounika M

Department of pharmacy practice, Chalapathi Institute of Pharmaceutical Sciences, Guntur

Epilepsies affect at least 2% of the population at some time in life, and many forms have genetic determinants I, II. We have found a mutation in a gene encoding a GABA-A receptor subunit in a large family with epilepsy.^(2,3) The two main phenotypes were childhood absence epilepsy (CAE) and febrile seizures (FS). There is a recognized genetic relationship between FS and CAE, yet the two syndromes have different ages of onset, and the physiology of absences and convulsions is distinct. (3)

The management of epilepsy in children requires careful evaluation, classification, and pharmacologic treatment (4,5). With classic antiepileptic drugs (AEDs), at least 25% of children remain refractory to appropriate therapy. The past decade has allowed the introduction of a number of newer AEDs for treatment of both adults and children with epilepsy. These include Felbamate, Gabapentin, Lamotrigine, Topiramate, Tiagabine, and Vigabatrin. Emerging information regarding the efficacy of these AEDs in treating childhood

To whomsoever it may concern

This is to certify that **Ms. B. Anusha**, pursuing **M.Pharm** from **Chalapathi Institute of Pharmaceutical Sciences, Guntur**, has undergone project training in our organization from **4th November 2016 to 5th May 2017**.

Ms. Anusha has successfully completed a project titled "**Analytical Method Development and validation for Simultaneous Determination of Lamivudine and Zidovudine by RP-HPLC**", under the guidance of **Mr. T. Srinivas Rao, DGM (QC)**.

She has maintained the requisite standards that were expected.

We wish her best of luck in her future endeavors.

TO WHOMSOEVER IT MAY CONCERN

This is to certify that Mr Ch.V.Mallikharjuna Rao is permitted to carry out his research work under our Analytical laboratory. This work is supervised and monitored by Head-Analytical manager during his tenure in our laboratory.

He was not permitted to publish his research work in national & international journals. The research work namely "Analytical method development and validation for the estimation of emtricitabine and tenofovir disoproxil fumarate in dosage form by RP-HPLC method" for academic purpose only. Not for any commercial use.

We wish him all the best

Regards,
