Abstract: The developed method for Efavirenz determined in tablet was found to be simple, sensitive, precise, selective, rapid and economic. Efavirenz exhibited maximum absorption at 291nm and obeyed Beer's law in the concentration range of 10-50µg/ml, showed linear regression $y=0.181x+1.071$ with correlation coefficient (r^2) of 0.999. Recoveries obtained do not differ significantly from 100% showed that there was no interference from the common excipients used in tablet formulation indicating accuracy and reliability of the method. The proposed method can be used for drug analysis in routine quality control & method proves to be more economical than the other standard methods. The developed and validated UV spectrophotometry method is rapid, simple, accurate, sensitive and specific. This method was validated as per ICH guidelines and results of accuracy, precision, ruggedness, was in the limit. There was no any interference of excipients in the recovery study. The method was also successfully used in quantitative estimation and analysis of Efavirenz from formulation.

Key Words: Efavirenz, Accuracy, Spectrophotometer, Quality Control.

Date of Submission: 17-01-2020

Date of Acceptance: 05-02-2020

I. Introduction

Efavirenz, a non-nucleotide reverse transcriptase inhibitor is used in highly active human immune deficiency virus type1. It is a white crystalline powder. Efavirenz is also used in combination with other antiretroviral agents as part of an expanded post exposure prophylaxis regimen to reduce the risk of HIV infection. The usual adult dose of Efavirenz is 600mg once a day. Efavirenz inhibits the activity of viral RNA-directed DNA polymerase. Antiviral activity of efavirenz is dependent on intracellular conversion to the active phosphorylated form. Thus, reverse transcriptase inhibitors are virustatic and do not eliminate HIV from the body. Even though human DNA polymerase is less susceptible to the pharmacologic effects of triphosphorylated efavirenz, this action may never account for some of the drug toxicity.

The UV- Spectrophotometric method for the simultaneous determination of Efavirenz and combination of few drugs were carried out with acetonitrile: water (50:50, v/v) solvent system. Linearity was observed over a range of 1-20µg/mL for Efavirenz, 1-10µg/mL. In another method a quantitative estimation of Efavirenz in bulk and tablets was described, in methanol: water (80:20, v/v), Efavirenz exhibits an absorption maximum at 245 nm and method obeys Beer's law.

EXPERIMENTAL SECTION

METHOD DEVELOPMENT

The develop simple, sensitive, accurate, precise, reproducible, rugged, and robust and relatively inexpensive analytical method (UV- Spectrophotometric) for the analysis of Efavirenz.

Instrument used UV-Visible spectrophotometer

DRUG PROFILE

DRUG NAME : Efavirenz

Abstract: A fixed oral dose combination of Atazanavir and Ritonavir is currently used for the treatment of patients with HIV infections. A selective and novel bio-analytical technique was designed to evaluate Atazanavir and Ritonavir by mass spectroscopic investigation in plasma matrices. The method was chromatographed with Agilent TC-C18, 4.6 x 75 mm, 3.5 μ m, 80 Å column, 5mM ammonium acetate: acetonitrile (20:80 v/v) mobile phase was used for Chromatographic separation. UV detector was used to detect the Atazanavir and Ritonavir at 235 nm. For extraction of the analyte and internal standard, Liquid-liquid extraction was employed. This method is validated over a linear concentration range of 50.0 – 10000.0 ng/ml for Atazanavir and Ritonavir with a correlation coefficient (r) of = 0.9997 and both drugs were stable in plasma samples.

Keywords: HPLC; Atazanavir, Ritonavir, Human plasma; Bio analytical

ABSTRACT: The endeavor of the present work is to develop a simple, economical, efficient, novel green analytical method for the estimation of Amlodipine besylate, Olmesartan medoxomil and Hydrochlorothiazide in pharmaceutical formulation. Quantification was carried out using an Inertsil CN-3.5 μ m (4.6 \times 250 mm) column, where the mobile phase consisting of 10 mM Phosphate buffer (pH 3.0) and Acetonitrile (40:60). The flow rate was 1.0 mL/min and the effluent was monitored at 262 nm. The observed linearity was in the range of 5-25 μ g/ml for Amlodipine (AMLO), Hydrochlorothiazide (HCTZ) and Olmesartan medoxomil (OLME) with a correlation coefficient of 0.997, 0.999 and 0.999 respectively. The proposed method was validated as per ICH guidelines in terms of linearity, accuracy, precision, robustness, and specificity, the limit of detection and limit of quantification. The method has been applied to Amlodipine, Hydrochlorothiazide and Olmesartan formulation without the interference of excipients of the formulation.

INTRODUCTION:

Amlodipine Besylate: Amlodipine Besylate (2-[(2-Aminoethoxy) methyl]- 4- (2-chlorophenyl)-1, 4-dihydro-6-methyl-3, 5-pyridinedicarboxylic acid 3-ethyl 5-methyl ester benzene sulfonate). Amlodipine is an L-type calcium channel blocker, which decreases the contraction of action and myosin fibers in the cardiac tissue by decreasing the supply of calcium ions. This results in a significant decrease in blood pressure ^{1, 4-8}. The chemical structure was shown in Fig. 1.

Formula: C₂₆H₃₁ClN₂O₈S

Chemical Structures of Drugs:

Abstract: A simple, efficient and reproducible method for the simultaneous determination of Clotrimazole and its Impurities (Imidazole and (2-chlorophenyl) phenyl methanone (2-chlorobenzophenone)) has been developed using reversed phase high performance liquid chromatography. The separation was carried out using a mobile phase consisting of Potassium dihydrogen phosphate buffer (pH 7.2): Acetonitrile (25:75 %v/v). Column used was SHIMADZU C₁₈ (4.6x250 mm, 5 µm) with a flow rate of 0.8 ml/min and the column temperature was maintained at 40 °C. The detection wavelength used was at 220 nm. The retention time of Clotrimazole, Imidazole and 2-chlorophenyl phenyl methanone (2-chlorobenzophenone) was 8.12, 7.56 and 3.02 min respectively. Linearity of Clotrimazole and its Impurity are in range of 0.013-0.076 mg/mL. For System Suitability % RSD was found to be 1.60 for Clotrimazole, 1.29 for Imp-D, 1.15 for Imp-E. The Mean% Recoveries were found to be within the range of 98-102 %. Analytical parameters were calculated and a statistical evaluation was included.

Keywords: Clotrimazole; Imidazole; 2-chlorophenyl phenyl methanone (2-chlorobenzophenone); HPLC; Simultaneous; estimation; Impurity.

ABSTRACT

Thiazolidinediones are a versatile scaffold of linking various classes of organic compounds with only one of its kind structural feature of hydrogen bonding donor and the hydrogen bonding acceptor region. Thiazolidinedione is an important heterocyclic ring system, is a derivative of thiazolidine ring which came into existence for its role as a ligand of Peroxisome proliferator activated receptor. A wide-ranging number of researches have led to determination of its huge biological profile with wide range of therapeutic applications. Thiazolidine-2, 4-dione is an outstanding heterocyclic moiety in the field of drug discovery, which provides various opportunities in exploring this moiety as an antidiabetic agent. In this review, an effort has been made to summarize the research work of various synthetic strategies for Thiazolidinedione derivatives as well as their biological significance.

Keywords: Thiazolidinedione, PPAR-gamma, antidiabetic activity.

INTRODUCTION

Historical aspects of Thiazolidinediones

Thiazolidinediones (TZDs) were first reported as insulin-sensitizing drugs in the early 1980s by the pharmaceutical company Takeda, but their mechanism remained a mystery until the mid-1990s, when they were found to be ligands for the nuclear receptor transcription factor PPAR γ . PPAR γ is expressed at high levels in adipose tissue, where it functions as a master regulator of adipocyte differentiation, and at much lower levels in other tissues. The simplest model for TZD function involves PPAR γ agonism in adipose tissue.

Thiazolidinediones (TZDs), or "glitazones," were first introduced for the treatment of type 2 diabetes in 1996, when troglitazone was approved by the Food and Drug Administration. Since the introduction of this unique class of compounds, many clinicians have embraced their use, whereas others have debated the role of insulin-sensitizing therapy for the management of type 2 diabetes.

Before the introduction of glitazones, conventional management of type 2 diabetes involved stepwise addition of medical nutrition therapy, sulfonylureas, and metformin. Despite broader use of early drug therapy, many patients do not achieve adequate blood glucose control. Even in those who do achieve treatment targets, a gradual deterioration in blood glucose control is often seen. These observations have prompted clinicians to use newer therapies, such as the glitazones, and have increased the use of early combination therapy to achieve glycemic targets.

Glitazones uniquely target insulin resistance—a core physiologic defect in those with type 2 diabetes and by so doing significantly improve glucose control. Glitazones improve insulin action in muscle, adipose, and hepatic tissue by acting as agonists of peroxisome proliferator-activated receptor- γ (PPAR- γ) nuclear receptors. Activation of PPAR- γ results in a myriad of both metabolic and vascular effects by up regulating and down regulating expression of numerous genes, including genes known to regulate lipid and glucose metabolism, vascular function, thrombotic function, and the inflammatory response. Glitazones increase nonoxidative glucose disposal, increase triglyceride synthesis, and improve free fatty acid (FFA) metabolism. Glitazones also lower blood pressure, improve lipid metabolism (raising HDL cholesterol, reducing triglyceride levels, and increasing concentrations of large, buoyant LDL particles), and improve vascular reactivity and rheologic abnormalities common to type 2 diabetes and insulin resistance.

Glitazones' unique effects suggest that these compounds may have significant advantages over other commonly used glucose-lowering therapies. The potential of several of these advantages are outlined below and establish both the clinical benefit of glitazone therapy and the clinical potential of these and other insulin-sensitizing therapies.

Diabetes Mellitus (DM) is an endocrine disorder resulting from an inadequate production or impaired use of insulin. Uncontrolled diabetes leads to chronic hyperglycemia (too much sugar in the blood). DM is a chronic disease for which there is no single cause. DM is often a secondary diagnosis to other disorders. Each year approximately 65,000 people are diagnosed with diabetes. Formulation and Evaluation of Pantoprazole Sodium Microspheres

N.Sunitha*¹, M. Naga Raju², Mr. Syed Muneer²

Chalapathi Institute of Pharmaceutical Sciences, Lam, Guntur.

K.C Reddy Institute of Pharmaceutical Sciences, Guntur.

Date of Submission: 15-11-2020

Date of Acceptance: 04-12-2020

ABSTRACT: Microspheres are typically free flow powders consisting of proteins or synthetic polymers which are biodegradable in nature and ideally having a particle size less than 200 μm . An attempt was made to prepare floating microspheres of pantoprazole using polymers of PVP and HPMC by coacervation technique. It was concluded that the drug release from the floating microspheres was controlled by the polymer. The nature of the polymers and their concentration influenced the physical and floating behaviour of the prepared microspheres. In vitro release data obtained from buoyant microspheres showed good buoyancy and prolonged drug release for formulations.

KEYWORDS Microspheres, Controlled released, HPMC, PVP, Pantoprazole.

I. INTRODUCTION

Drug delivery systems (DDS) that can precisely control the release rates or target drug to a specific body site have had an enormous impact on the health care system. The last two decades there has been a remarkable improvement in the field of novel drug delivery systems. Carrier technology offers an intelligent approach for drug delivery by coupling the drug to a carrier particle such as microspheres, nanoparticles, liposomes, etc. which modulates the release and absorption characteristics of the drug. Microspheres constitute an important part of these particulate DDS by virtue of their small size and efficient carrier characteristics.

Ion gelation technique is one of the several methods that is used for production of microspheres. Although this way may not be the main method, but it is the simplest one that several variables can affect the outcome, as well.^[1]

Sustained release microspheres may be produced by several methods utilizing emulsion system (oil-in-water, oil-in-oil, water-in-oil-in-water), as well as by spray drying. The common emulsion system used oil-in-water (o/w), with microspheres being produced by the emulsion solvent evaporation method. This relatively simple

method enables the entrapment of a wide range of hydrophobic drugs.^[2]

Pantoprazole is used to treat certain stomach and esophagus problems (such as acid reflux). It works by decreasing the amount of acid your stomach makes. This medication relieves symptoms such as heartburn, difficulty swallowing, and persistent cough. It helps heal acid damage to the stomach and esophagus, helps prevent ulcers, and may help prevent cancer of the esophagus. Pantoprazole belongs to a class of drugs known as proton pump inhibitors (PPIs).

Appearance: White to off white amphoteric crystalline powder.

Solubility: freely soluble in water and slightly soluble in phosphate buffer at pH 7.4. Water Solubility : 0.431 mg/mL

Molecular Formula : $\text{C}_{16}\text{H}_{14}\text{F}_2\text{N}_3\text{NaO}_4\text{S}$

Molecular Weight : 423.367 g/mol

Iupac Name : Sodium;5-

(difluoromethoxy)-2-[(3,4-dimethoxyphenyl)methylsulfinyl]benzimidazole-1-ide;hydrate

Storage: Store Pantoprazole at 20° - 25°C (68° - 77° F); excursions permitted to 15° - 30°C (59° - 86° F)

Category: Proton Pump Inhibitor (PPI)

Melting point: 139-140°C

Log P: 2.18

Bioavailability: 77%

Half life: 1-2 hr

ABSTRACT

The present work is to screen the selected phytochemicals for alleviate chemical induced acne in mice. The treatment for acne with synthetic drugs have various drawbacks, usage may lead to development of resistant towards these drugs. Hence plants derived compounds are required to overcome the above drawbacks and treat the acne. Present study was aimed to evaluate anti acne potential of selected phytochemicals on the primary clinical lesion, microcomedone, which are the precise, almost all other acne lesions by applying topically on skin. Animals of either sex were collected from the animal house of Chalapathi Institute of Pharmaceutical sciences were randomized into 10 groups consisting of five animals/ group. Benzalkonium chloride used for inducing acne. The test compounds (2% geraniol, 2% hesperidine 2% ellagic acid and 2%liquorice) showed that decreased the inflammation in mice ear. On the 10th day there was a significant decrease ($p < 0.0001$) in inflammation (0.66 ± 0.1503 , 0.32 ± 0.0734 , 0.32 ± 0.0734) with respective to the disease control. The test compounds at 2% showed significant reduction in the overall damage caused by acne induced by chemical contact and reduced the proliferation of inflammatory cell into the ear region.

ABSTRACT: In this study, we used methanolic extract of *Morinda citrifolia* Linn. fruit (MMC) in order to find its effect against ethanol seeking behavior in a modified mouse runway paradigm. During conditioning/acquisition animals were treated with accelerated doses of ethanol (0.5-4 g/kg, i.p.) for 5 days (Day 1- Day 5). Then, ethanol seeking behavior was assessed on Day 6 (postconditioning test). Ethanol seeking behavior was confirmed in ethanol control group in which the run time to reach the target box was significantly decreased. The test drug MMC (1, 3, and 5 g/kg, p.o.) caused a significant reversal of the ethanol seeking behavior by increasing the run time to reach the goal box as seen with the reference drug acamprosate (ACAM; 300 mg/kg, p.o.) in mice. After postconditioning test, non-rewarded abolishment assays were performed for a period of five days (Day 7 -Day 11). After 5 days of abolishment (abstinence), a priming dose of ethanol (the highest dose at 1/5th portion applied in control (i.e. 0.8 g/kg, i.p.)) in house cage significantly reinstated the ethanol-seeking behavior. Interestingly, MMC at a higher dose (5 g/kg, p.o.) showed significant halt on ethanol-induced reinstatement in mice as shown with the reference drug ACAM (300 mg/kg, p.o.). The outcome of this study reveals that MMC alleviated ethanol seeking behaviour in modified mouse runway paradigm and it could be effectively used to treat alcohol dependence.

KEYWORDS: Alcohol dependence; acamprosate; *Morinda citrifolia* Linn; mouse runway paradigm; self-administration.

1. INTRODUCTION

The motivational effects of numerous consummatory reinforcers including food, water and drugs of abuse have been extensively studied using a test on alley running performance in rodents [1]. Traditional runway models of operant drug reward have been restricted by systematization aspects related to the requirement to ensure medicament delivery to the animal over heavy distances beside intervening with the runway behavior of rats [2]. Ideally, one would want a system with precise motivational and confounding factors that should not affect animal behavior. Recently, we developed a novel runway model of drug self-administration using mice without compromising a great active long-term analysis of runway efficient performance for drug reward [3].

Morinda citrifolia Linn. (Noni) has been utilized as diet source, medicine, and fabric dyes by Polynesian people [4]. Traditionally, *M. citrifolia* has been widely used as prophylaxis and treatment of many CNS disorders such as anxiety, depression, psychosis and drug dependence. In earlier study by our research group, MMC was reported for anxiolytic and antidepressant-like activity [5] anti-psychotic-like activity [6] and anticraving effect in opposition to heroin, ethanol and methamphetamine dependence using conditioned place preference test in rats and mice [7-10]. The current investigation was designed to test the activity of MMC against ethanol seeking behavior in mice by employing modified runway paradigm of self-administration of drug.

Accepted: 03-Jun-2020

Published: 20-Oct-2020

ABSTRACT

Background: *Mitragyna speciosa* Korth possesses a wide range of therapeutic benefits, despite having abuse liability. **Objectives:** The purpose of this research was to investigate the reinforcing properties of *M. speciosa* Korth leaf extract obtained via methanol extraction using mouse conditioned place preference (CPP) test. **Materials and Methods:** In CPP study, following baseline preference test (preconditioning score), the mice were subjected to conditioning trials at varying doses of methanolic extract of *M. speciosa* (MMS, 50, 75, 100, 250, 500, and 1000 mg/kg, p.o.) or reference drugs methamphetamine (0.5 mg/kg, intraperitoneally [i.p.]) and clozapine (1 mg/kg, p.o.) or vehicle controls (1% w/v sodium carboxy methyl cellulose [10 mL/kg, p.o.] and saline [10 mL/kg, i.p.]) followed by a preference test performed under drug-free state (postconditioning score). In addition, the effect of all tested drugs on the spontaneous locomotor activity was assessed. **Results:** The CPP study results revealed that MMS *per se* produced a significant place preference only at higher doses (>500 mg/kg, p.o.). Nevertheless, MMS at lower doses (50–250 mg/kg, p.o.) did not induce CPP in mice. In addition, MMS at all tested doses (50–1000 mg/kg, p.o.) did not affect the spontaneous locomotor activity in mice. **Conclusion:** MMS *per se* exhibits reinforcing properties at only an increased dose of >500 mg/kg, and therefore, it is best to administer at lower doses (<250 mg/kg) for the potential therapeutic benefits in preclinical studies. **Key words:** Clozapine, conditioned place preference, drugs abuse, methamphetamine, *Mitragyna speciosa*

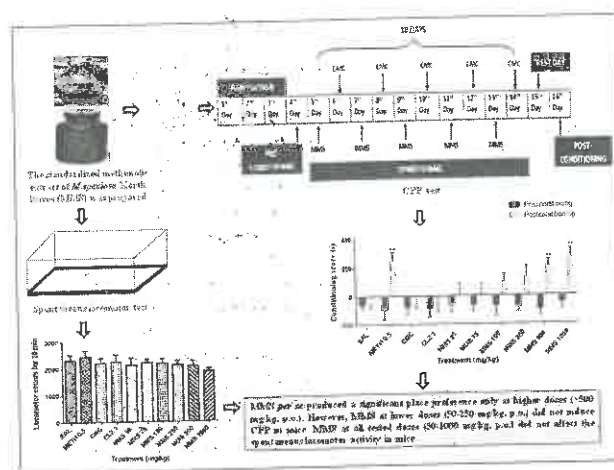

SUMMARY

- The methanolic extract of *Mitragyna speciosa* (MMS) leaf showed a place preference in conditioned place preference test only at higher doses (>500 mg/kg) in mice, which was comparable to the reference drug methamphetamine (0.5 mg/kg). However, MMS did not display place preference at lower doses (<250 mg/kg) in mice. The study results suggest that MMS could have addictive potential at higher doses, and it should be used only at lower doses (<250 mg/kg) for any therapeutic investigations in preclinical research.

INTRODUCTION

The application of cannabis, coca, and opium poppy in hospitals and medical surgeries was dated back to few centuries ago. Morphine obtained from the opium poppy drips in hospitals served as a potent pain killer; cocaine obtained from *Erythroxylon coca* plant served as an anesthetic agent in certain medical surgeries; and cannabinoids obtained from the cannabis plant are used for the treatment of chemotherapy-induced nausea and vomiting and epileptic seizures.^[1-4] Although these plants were proved to be beneficial in all aspects mentioned above, the addictive and fatality potentials of these plants are undeniable. Appropriate use of these drugs in terms of dose, dosage forms, and duration of the treatment makes them beneficial rather than harmful. *Mitragyna speciosa* is one such plant that possesses vast therapeutic benefits with addictive potential. Identifying the nonaddictive dose of *M. speciosa* leaf extract is crucial in novel drug discovery for various ailments.

M. speciosa is a tropical tree mostly found in Thailand and Northern Malaysia, which has been used conventional for therapeutic and

A prospective observational study on acute exacerbation of chronic obstructive pulmonary disease in pulmonology department of tertiary care hospital

Sreenu Thalla^{1*}, Akhila Yerubandi², Sk. Hafeezunnisa², Sk. Jareena² and Sivakshari Makkapati²

Abstract

Background: Chronic obstructive pulmonary disease (COPD) is a common, preventable, and treatable disease that is characterized by persistent respiratory symptoms and airflow limitation that is due to airway and/or alveolar abnormalities usually caused by significant exposure to noxious particles or gases. An acute exacerbation of COPD refers to a flare up or episode where a person breathing becomes worse than normal. An acute exacerbation of COPD refers to a flare up or episode where a person breathing becomes worse than normal. Acute exacerbation in COPD (AECOPD) is frequent in the course of the illness and is the most common reason for medical visits, hospital admissions, and mortality among these patients. Exacerbations of COPD are associated with increased morbidity and mortality. To assess the exposure and severity of acute exacerbations of COPD with COPD Assessment Test (CAT Scale) and mMRC (modified Medical Research Council) Dyspnea scale. Study design was a hospital-based prospective observational study. Study site was conducted at Pulmonology Department of Government General Hospital, Vijayawada.

Results: The total patients were 197. Out of which, 119 were from In-patient Department (IPD) and 78 were from Out-patient Department (OPD). In this study, males were 167 (85%), among which, IPD were 97 (49%), OPD were 70 (36%), and females were 30 (15%), among which, IPD were 22 (11%), OPD were 8 (4%).

Conclusion: The morbidity and mortality of COPD have been increased in recent years. This study concludes that there is a relation between risk of acute exacerbations in COPD with habitual history and occupational history. Increase in exposure to occupational hazards, smoking habit leads to an increase in risk of acute exacerbations in COPD patients. The level of severity was more in smokers and the patients who had biomass, organic dust, and mineral exposure. When severity was observed, group D severity is more observed in population according to CAT scale and mMRC dyspnea scale.

ABSTRACT

Memory impairment (MI) is one of the predominant criteria generally used to identify schizophrenia, dementia and amnesia that are associated with neurodegenerative disorders by evaluating patient's cognitive symptoms. To date, there is no available treatment that can completely mitigate MI. Currently, there is a trend in recent investigations towards symptomatic therapy approaches using a variety of natural compounds. Mangiferin is one of them that have been investigated extensively. Mangiferin is a naturally occurring potent glucosylxanthone and is mainly isolated from the *Mangifera indica* (Mango) plant. This review is aimed at providing a comprehensive overview on the efficacy of mangiferin on MI, based on *in-vivo* animal studies. After screening through articles identified from Scopus and PubMed based on the inclusion and exclusion criteria, a total of 11 articles between 2009 and 2019 were included. The minimum and maximum dose of mangiferin were 10 and 200 mg/kg respectively and administered over the period of 12–154 days. The results of 11 articles showed that mangiferin effectively improved spatial recognition, episodic aversive events, short- and long-term memories primarily occurring via its antioxidant and anti-inflammatory effects. The outcomes of the review revealed that mangiferin improves memory and cognitive impairment in different animal models, indicating that it has potential preventive and therapeutic roles in MI.

A Case Control Study on Factors Influencing Suicide Attempts

Sushmitha Gutti^{1,*}, Surya Sunanda Koppisetty¹, Sruthi Paladugu¹, Maddirevula Maneesh Kumar Reddy¹, Nalluri Murali Krishna², Nadendla Rama Rao³

¹Department of Pharmacy Practice, Chalapathi Institute of Pharmaceutical Sciences, LAM, Guntur, Andhra Pradesh, INDIA.

²Department of Head the Psychiatry, Government General Hospital, Guntur, Andhra Pradesh, INDIA.

³Chalapathi Institute of Pharmaceutical Sciences, LAM, Guntur, Andhra Pradesh, INDIA.

ABSTRACT

Aim: We aim to study psychosocial, socio-demographic and personality related factors associated with suicide attempts. **Methods:** From 1st September 2018 to 28th February 2019, we conducted a hospital-based case control study in Department of Psychiatry, Government General Hospital, Guntur, India. One hundred forty-five cases and one hundred forty five age and sex matched controls were selected for study. Eysenck Personality Questionnaire, Modified kuppaswamy scale, Presumptive Stressful Life Event Scale, Suicide Intent Scale were used. Statistical analysis was done using computerized software. **Results:** Majority (n=69, 47.58%) of the suicide attempters were between 21-30 years of age. The number of suicide attempters are more in rural areas than in urban areas and it is statistically significant with an Odds Ratio 2.39. The risk of suicide attempts is more in people who are uneducated (OR – 1.51). It was observed that being an alcoholic will increase the risk of suicide attempt (OR-1.73). The average of PSLES score of individuals is more in case group (166.8) than control group (111.386). Having a family history of suicide attempts will increase the risk of suicide attempt (OR -2.28). **Conclusion:** Residing in rural areas, alcoholism, having no support from family members and having more stress full life events emerged as predominant risk factors for attempting suicide.

Key words: Suicide attempt, Socio-demographic factors, Personality traits, Stressful life events, Suicide intent, Psychiatric illnesses.

INTRODUCTION

Suicide can be defined as death caused by self-directed injurious behaviour with an intent to die as a result of the behaviour whereas Suicide attempt is a non-fatal, self-directed, behaviour with an intent to die as a result of the behaviour; might not result in injury.¹ Suicide attempt may occur up to 20 times more frequently than completed suicide. Suicide attempt is mostly associated with adverse long-term situations like psychiatric and medical comorbidity, hospitalization, repeated suicide attempts, poverty, chronic stress and stigma.² India's contribution to global suicides increased about 11.3% from 1990 to 2016. India comprised about 17.8% of world population but accounted for 36.6% of suicides among women and 24.3% among men in 2016.³ A total number of 6226 suicides were reported in Andhra Pradesh in the year 2015 among them 1916 that is 30%

of the suicides were due to illness which is the 3rd highest percentage share in all India average of suicides due to illness. Rate of suicides in Andhra Pradesh during the year 2105 is 12.1 per one lakh population.⁴ Suicidal behaviour has a large number of hidden (under) causes. The factors that place people at risk for suicide are complex and interact with one another. Identifying these factors and understanding their roles in suicidal behaviour are central to prevent suicides.⁵ People with a diagnosed mental health condition are shown to be at a higher risk of attempting and completing suicide,⁶ with more than 90% of suicides and suicide attempts having been found to be associated with a psychiatric disorder. Across the globe, the highest rates of suicide were associated with depressive disorders across the globe.⁷ In order to clearly understood the role of

Abstract:

Chronic myeloid leukemia is a myeloproliferative disorder. Imatinib mesylate (Gleevec®) is a first line pharmacologic treatment for all phases of chronic myeloid leukemia and for advanced gastrointestinal stromal tumors (GISTs). Imatinib mesylate is generally well tolerated. Well-known ocular side effects for Imatinib are periorbital edema, epiphora, conjunctival hemorrhage, blepharconjunctivitis, visus alterations and ocular dryness and also optic disc edema is the rare ocular event associated with Imatinib use. Here we reported a case of 58-year-old Caucasian male was diagnosed with Chronic Myeloid Leukemia (CML) and he is treating with Imatinib for 7 years. Patient was presented with moderate periorbital edema along with optic disc edema and these ocular events can be self reducible in our case after suspension of Imatinib for 1 week without any treatment. Prompt consultation with an ophthalmologist can lead to early detection, proper diagnosis and appropriate therapeutic measures.

Abstract

Background: In patients receiving multi-drug therapy, drug-drug interactions (DDIs) are of extensive concern. The term drug-drug interaction is used when the effect of one drug is altered by the concomitant use of another drug. **Aim:** To analyze the impact of clinical pharmacist in evaluating drug-drug interactions in outpatients of a tertiary care hospital in various departments in a tertiary care hospital. **Objectives:** To assess the prevalence of drug-drug interactions and severity of DDIs. **Material and Methods:** This study was a cross-sectional, observational study conducted for a period of 6 months from July 2019 to December 2019. The medications in the patient profile forms were then entered into the Excel sheet. The DDIs were classified based on the number of drug interactions, number of prescriptions, severity, mechanism of actions and different variables related to Drug Interaction were also determined. **Results:** From 126 patients, 69% males were more prone to DDIs than females that are 30.9%. Majority of the patients belongs >65 years of age (34.9%). A total of 126 prescriptions were analyzed of which 550 prescriptions had DDIs. Most of the DDIs were pharmacodynamic (50.7%) followed by pharmacokinetic (30.9%) and unknown (18.2%). A severity assessment showed that majority of the DDIs were moderate (27.7%) followed by major (20.6%), minor (41.2%) unknown (10.3%). Based on the different variables, comorbid conditions and total number of drugs prescribed were statistically significant with DDIs. **Conclusion:** The chances of occurrence of drug-drug interactions are more prevalent in the current hospital settings. Our study helped to understand the most prone age group, common mechanisms and severity and different variables that affect the patient's disease condition.

ABSTRACT

Gynecomastia is proliferation male breast tissue due to an imbalance in estrogen and androgen action. Though it is rare it causes anxiety, embarrassment and physical discomfort in the affected male. This case report is of a 69-year-old male patient who presented with the symptom of painful swelling in his both breasts. He is suffering from hypothyroidism, type 1 diabetes mellitus and myocardial infarction from past few years and using Eltroxin, Atorvastatin, Aspirin, Clopidogrel, Glimepiride and Metformin. He was also diagnosed with clinically controlled Congestive Cardiac Failure (CCF) for which he was prescribed Lasilactone (Furosemide 20mg and Spironolactone 50mg) and developed enlargement of his breast after 9 months of treatment and diagnosed by the physician as bilateral gynecomastia. The physician withdrawn Lasilactone and added Furosemide 40mg. but the poor prognosis of his pedal edema caused by his CCF made the patient to take Lasilactone and the symptoms of gynecomastia recurred again. Diagnosing drug induced gynecomastia and discontinuing the drug causing it will prevent the need of surgery for gynecomastia.

KEYWORDS: Spironolactone, Gynecomastia, Case report.

INTRODUCTION

Benign proliferation of male breast glandular tissue due to imbalance between estrogen action relative to androgen action at the breast tissue level appears to be the main etiology of gynecomastia.^[1] Asymptomatic gynecomastia is more common in healthy adult male with a prevalence of 32-65% and the prevalence of symptomatic gynecomastia is lower.^[2] Though there may be several endocrine etiologies which will affect hormonal balance for gynecomastia. Its association with drugs is not fragile.^[3] Gynecomastia coexists with many pathological conditions, including chronic liver disease, which is of unquestionable epidemiological importance for the Polish population. Another common trigger for gynecomastia -inducing mechanisms may be drugs, affecting the hormonal balance.^[2] Drug-induced gynecomastia is common and might account for a quarter of all cases, including those among children.^[3] The drugs that can cause gynecomastia are listed in Table 1. Although the mechanisms by which many medications induce gynecomastia are not yet understood, some mechanisms are clear.^[4] This is a case report of 69year

old male who developed spironolactone induced gynecomastia.

Abstract:

In India the Breast cancer is the most common type of cancer in women. The patients with breast cancer were facing many problems neither by the disease nor by the treatment side effects. So that measuring quality of life in patients with breast cancer is important for assessing the treatment outcomes. Thus in our study we analysed the impact of treatment on quality of life of women with breast cancer. The purpose of present study is to assess the quality of life in breast cancer patients to manage their treatment and to prevent further progression of disease.
